

1. I started off by creating the tables  
(customers, tickets, movies & concessions)

2. I created a customer\_id for each customer  
which will have their first\_name, last\_name &  
payment method (credit, debit, cash, online,  
etc.)

3. I created a tickets table which will create a  
ticket\_number for each ticket which will link to  
the customer\_id

4. I created a movies table which will give  
each movie\_name a movie\_id, this will link to  
the ticket\_number which will then link to the  
customer\_id

5. I created a concessions table where it will  
give each concession order a concessions\_id, it  
will list the concessions\_name (popcorn, candy,  
etc.), will have the amount of the  
order/concessions\_id which will link to the  
customer\_id
